

Practical Exercise

Using [Terraform](#) Build the following:

1. A VPC containing reasonable subnets for deploying AWS EC2's.
2. An EC2 within the VPC that has reasonable IAM permissions and associated resources.

Using [Ansible](#) configure the following on the EC2.

1. Install a nginx server on the EC2.
2. Configure the nginx server to be able to serve its pages across HTTPS (can use self-signed certificate).

Using [Packer](#)

1. Use [Packer](#) to run Ansible to produce an AMI that contains the nginx with HTTPS support.
2. Configure the same nginx on a Windows EC2.

Deliverables

1. The Terraform template that was used to create the AWS resources.
2. The Ansible script that was used to configure the nginx server.
3. Some screen shots showing the relevant resources successfully created in the AWS Account.
4. Some screenshots of the results of HTTPS requests to the nginx server.

Instructions: please complete this assignment within 5 days. Please use your own AWS sandbox environment.
